

APPLICATIONS AND RATES

GENERAL INFORMATION

Every Tank is a spray tank acidifier, which corrects alkaline hydrolysis of pesticides, and fertilizers, and neutralizes bicarbonates (hard water) in the spray tank solution. **Every Tank** makes all products in the spray tank more efficient by increasing the solubility of the spray tank water and reducing the likelihood of precipitates forming and settling out of solution, and or clogging filters and spray tips. **Every Tank** has a built-in color indicator, making pH adjustments easy. pH levels can be determined simply by observing the color of the spray tank water as shown in the chart below.

DIRECTIONS FOR USE

Add **Every Tank** into the spray tank prior to adding pesticides or fertilizers. Determine the pH of the spray tank from the chart below. The typical rate for **Every Tank** is 4-8 ounces per 100 gallons of water which decreases water pH from 8.5 to 5.0 depending upon the water source.

WATER pH COLOR INDICATOR KEY

Pale yellow: pH = 7.0

Golden yellow: pH = 6.0 - 6.5

Red: pH = 4.5 - 5.0

****A jar test is always recommended to check the compatibility of unfamiliar or new combinations prior to mixing and applications. Mixing order is important; a change in the order of addition can affect product performance.**
